# The EmbedCare Brain

One-page summary, 31 October 2026

EmbedCare is a white-label telehealth platform. In about six weeks its president, Nate, built a system where every conversation the company has lands in one private, versioned store. Scheduled AI routines read that store and do the day's operating work: they file records, draft tickets and replies, bill signed contracts, keep the CRM current, prepare the daily meeting and watch for errors and privacy leaks. The few decisions that need a person reach Nate's phone with Send, Hold and Skip buttons.

## FOUR LAYERS

**1 Capture**
Email, meeting notes, call transcripts, Telegram, accounting reports, portal events and bookings land in the store automatically. Duplicates are removed, credentials redacted, and every change is scanned for secrets.

**2 Index and records**
A build job turns the raw files into an index, a list of every promise anyone made with its due date, and one record per client.

**3 Operate**
About forty scheduled routines and jobs on a day clock from 06:00 to 19:30. Each has one job and leaves a file the next one reads.

**4 Guardrails**
Output checks with a deadline per job, an error watch, a daily privacy scan, and nightly snapshots so any change can be rolled back.

## ONE ORDINARY WEEKDAY

| | |
|---|---|
| **06:00** | Call transcripts and the chat digest filed |
| **06:15 to 06:50** | Email filed, index rebuilt, promises nudged |
| **07:15 to 07:20** | Meeting notes to the CRM, promises extracted |
| **07:30 to 07:45** | Ticket drafts, privacy scan, error check |
| **08:00** | A signed contract is billed, untouched by hand |
| **08:30 to 08:53** | Agenda built, pitches answered in draft |
| **09:00** | **Five drafts reach Nate's phone** |
| **14:00 to 14:20** | Accounting reports, overdue invoices |
| **16:00 to 18:00** | Contracts again, tickets, an account update |
| **19:30** | New leads become CRM deals with owners |

**Nothing reaches a client without a human tap.**
Filing, indexing, CRM upkeep and invoice instructions to the company's own accounting team run on their own. Every message to a client or partner stays a draft until Nate taps Send.

## THE NUMBERS

**45**
routines, feeds, jobs and loops

**1,000+**
items indexed since late July 2026

**1,000+**
Telegram messages captured in the last 7 days

**500+**
commitments tracked, each with an owner and a due date

## FIVE RUNTIMES

- **Cloud AI routines** on a schedule, each with a written playbook
- **A no-code automation platform** for the feeds into the store
- **GitHub Actions** that rebuild the index on every push
- **An always-on Telegram bot** for capture, checks and taps
- **Two small connectors** for reading and writing the store

## WHAT IT IS NOT YET

**Capture** — 9 of 10
Every channel lands in one versioned store, deduplicated, redacted and scanned.

**Operate** — 7 of 10
Real work ships daily, but every approval goes through one person and nothing measures cycle times yet.

**Serve** — 4 of 10
It answers Nate, not yet the team or clients. Client questions are still answered by hand.

## BEING BUILT NEXT, IN ORDER

1. **Client records, finished.** Routines write to one record per client instead of re-deriving it.
2. **Status answers for the team.** "Where is this client" answered from stored answers, approved by an account manager.
3. **The metrics layer.** Reply times, signed to live and overdue promises per owner, computed so they trend.

Built by one person with Claude, Make, GitHub and a Telegram bot, August to October 2026. Numbers as of 31 October 2026.
